PV-04 INOX Container lock

Description

PV-04 INOX is stainless-steel horizontal clasp used for blocking bolts of container doors. Spacing of clasp arms may be adjusted by automatic step positioning. The clasp fastens steel blocking bolts (bars), protecting the doors against being opened. Clasp arms movement is blocked by steel pin quick-locked by disc-lock. Locks without a key by manual pressing the lock in. Unlocks only with a key.

The cam lock is resistant to drilling and vibration picking methods. PV-4 INOX is made of stainless steel - a steel characterized by special physicochemical properties resistant to corrosion caused by atmospheric factors (gaseous corrosion), diluted acids or alkaline solutions (corrosion in fluids).

PV-04 is used as an effective additional anti-break-in protection for containers in transshipment bases and during the drive. Recommended for transport and package delivery companies.

Technical information

- Material: stainless-steel AISI 304,
- Cylinder: GERDA cylinder
-

Optios

- Equal conclusive or master key system
